

Attaching Tie

Inventor: Anatoliy Ivanovitch Rudenko

Filed: 08/21/2003

Appl. No.: 10/644,618

ABSTRACT

The purpose of the invention is to keep a tie in a still position and to restrict the free movement of the tie because of wind. It also prevents the movement of the tie under a jacket aside while walking as well as it prevents the discomfort while bending or sitting down without a jacket. The functional constituent of the invention is an industrially manufactured hair clip/barrette and a leather, or another flexible material, stripe. The invention functions by clipping a tie to the strap of a shirt. Such attachment allows keeping the tie in a still, fixed position without restraining the free movement of a wearer at the same time.
